Is Your Pet Pad Too Hot or Cold?

Before use, please read the instructions on the box of your Pet Pad for the correct operation.

The heat output from the Pet Pad is low and similar to an electric blanket on its lowest setting.

Note: When plugged in the pet pad won't immediately feel warm and will not feel warm while exposed to the air.

- The Pet Pad is designed to work with a thin material cover.
- When the pad is placed on a blanket or bedding, your pet will feel the warmth generated as it lies on the pad.
- The material underneath the pad can be varied to change the temperature of the pad as defined below:
 - If the pad is too cold, add additional bedding / blanket(s) underneath the pad.
 - If the pad is too hot, remove bedding / blanket(s) from underneath the pad.

You can test the warmth of your pad by placing your hand between your pet and the top surface of the pad.

This Pet Pad is proudly designed, manufactured and tested in New Zealand and meets the NZ Standards AS/NZS 60335.1:2011 and AS/NZS 60335.2.17:2004.
